## Mol to mass

## Sample Problem

Potassium chlorate is sometimes decomposed in the laboratory to generate oxygen. The reaction is $2 \mathrm{KClO}_{3}(s) \rightarrow 2 \mathrm{KCl}(s)+3 \mathrm{O}_{2}(g)$. What mass of $\mathrm{KClO}_{3}$ do you need to produce $0.50 \mathrm{~mol} \mathrm{O}_{2}$ ?

## Solution

ANALYZE
What is given in the problem?
the amount of oxygen in moles
What are you asked to find?

| Items | Data |  |
| :--- | :--- | :--- |
| Substance | $\mathrm{KClO}_{3}$ | $\mathrm{O}_{2}$ |
| Coefficient in balanced equation | 2 | 3 |
| Molar mass* | $122.55 \mathrm{~g} / \mathrm{mol}$ | NA |
| Amount | $? \mathrm{~mol}$ | 0.50 mol |
| Mass | $? \mathrm{~g}$ | NA |

## Mole to mole

So the question in words is: If 2 mol of $\mathrm{KClO}_{3}$ is needed to create 3 mol of $\mathrm{O}_{2}$, then how much is needed to create 0.50 mol ?

You can slve this problem in various ways but the easiest would be to use a rule of three.
$3 / 0.5=6$ (So we have a sixth part of the balanced equation)
If we no calculate a sixth of the 2 mol of $\mathrm{KClO}_{3}$ we will get the amount of mol need, so: $2 / 6=0.33 \mathrm{~mol}$ of $\mathrm{KClO}_{3}$

## Mole to mass

Now you simply need to apply the formula again to calculate the mass if you have the mol. So: Mol $\times$ Molecular mass $=$ mass of substance
$0.33 \times 122.55 \mathrm{~g} / \mathrm{mol}=40.44 \mathrm{~g}$ of $\mathrm{KClO}_{3}$

## San Francisco de Paula <br> Practice

1. Phosphorus burns in air to produce a phosphorus oxide in the following reaction:

$$
4 \mathrm{P}(s)+5 \mathrm{O}_{2}(g) \rightarrow \mathrm{P}_{4} \mathrm{O}_{10}(s)
$$

a. What mass of phosphorus will be needed to produce 3.25 mol of $\mathrm{P}_{4} \mathrm{O}_{10}$ ?
b. If 0.489 mol of phosphorus burns, what mass of oxygen is used? What mass of $\mathrm{P}_{4} \mathrm{O}_{10}$ is produced?
2. Hydrogen peroxide breaks down, releasing oxygen, in the following reaction:

$$
2 \mathrm{H}_{2} \mathrm{O}_{2}(a q) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(l)+\mathrm{O}_{2}(g)
$$

a. What mass of oxygen is produced when 1.840 mol of $\mathrm{H}_{2} \mathrm{O}_{2}$ decomposes?
b. What mass of water is produced when $5.0 \mathrm{~mol} \mathrm{O}_{2}$ is produced by this reaction?
